The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a bioactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  17-SEP-1998

New nucleic acids encoding polypeptides designated PRO have sequence identity to various secreted proteins and transmembrane proteins and useful in molecular techniques and as therapeutic agents. are

Example 42; SEQ ID NO 286; 474pp; English

The invention discloses isolated PRO secreted/transmembrane polypeptides CC and the nucleic acid encoding them. The polypeptides can be used to raise CC antibodies that specifically bind to the pRO polypeptide for Inking a CC bloactive molecule to a cell expressing a PRO polypeptide for modulating CC for detecting other PRO polypeptides in a sample and for modulating CC for detecting other PRO polypeptides in a sample and for linking a polypeptide antibodies are useful for modulating the biological activity of a cell. PRO polypeptides or coll expressing PRO polypeptides or polypeptides are useful for modulating the biological activity CC of a cell expressing PRO polypeptides. The PRO polypeptides or polypeptides are useful for stimulating the biological activity CC of a cell expressing PRO polypeptides. The PRO polypeptides or collar inhibiting vascular endothelial growth factor (PEGP)-stimulated CP prohiferation of endothelial cells, modulating the proliferation of collar endothelial cells, modulating the proliferation of cells, inducing c-fos in endothelial cells, modulating the proliferation of cells, inducing c-fos in endothelial cells, modulated Tlymphocytes, enhancing the survival or proliferation of cells, modulating the proliferation of cells, inducing c-fos in endothelial cells, modulating the proliferation of cells, inducing c-fos in endothelial cells, modulated Tlymphocytes, enhancing the survival or proliferation of cells, inducing c-fos in endothelial cells, modulating the proliferation of cells, inducing c-fos in endothelial cells, modulating the proliferation of cells, inducing c-fos in endothelial cells, modulated the cells, modulating the proliferation of cells, inducing c-fos in endothelial cells, modulated the cells, modulated the cells, cells, the cells cells, modulated the cells, cells, cells, cells, cells, cells, cells

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         immunohistochemical staining and/or assay of sample fluids. Anti-PRO antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                             17-SEP-1997

The PRO polypeptides. The PRO polypeptides are useful for modulating the biological activity CC of a cell expressing PRO polypeptides. The PRO polypeptides or complete the provides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. These are useful for stimulating hypertrophy of meonatal complete the proliferation of endothelial cells, modulating he proliferation of complete the proliferation of complete the proliferation of complete the survival or proliferation of complete the cells, inducing c-fos in endothelial cells, modulating the proliferation and/or receival the complete the comp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CONAS, in Chromosome and gene mapping, in the generation of antisense RNA CI and DNA, for preparing PRO polypeptides, for generating transgenic animals which are useful in the development and screening of therapeutically useful reagents, as probes and for the genetic analysis of individuals with genetic disorders as well as for recombinantly expressing the protein and for chromosome identification. The proteins are useful as molecular marker for protein electrophoresis purposes, as therapeutic agents, for screening compounds to identify those that mimic the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (antagonists). The polynucleotides and proteins are useful for tissue typing. PRO antibodies are useful for tissue typing. PRO antibodies are useful for antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity.
                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Isolated secreted and transmembrane PRO nucleic acids and the proteins they encode, e.g. PRO245, PRO269 and PRO1868, useful for preventing, diagnosing and treating e.g. disorders relating to blood coagulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  genes may also be used in gene therapy, particularly for replacing a ective gene. The sequence presented is a PCR primer which was used to lify a PRO polynucleotide of the invention.

WPI; 2004-021580/02

New PRO polypeptide for preparing a medicament for treating a condition that is responsive to the PRO polypeptide or anti-PRO antibody, e.g. inflammatory diseases, cancer or acquired immunodeficiency syndrome.

Example 42; SEQ ID NO 286; 476pp; English.

Condition of sciouse isolated from serieucy, Lansmendrate Condition and the nucleic acid encoding them. The polypeptides can be used to raise controlled to a cell expressing a PRO polypeptide, for linking a controlled for a cell expressing a PRO polypeptide and for modulating controlled for detecting other PRO polypeptides in a sample and for inking a controlled for detecting other PRO polypeptides in a sample and for linking a controlled for entirely a cell expressing a PRO polypeptide. The PRO polypeptides are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or controlled for entirely properties are useful for stimulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or controlled for the proliferation of endothelial cells, modulating the proliferation of controlled for stimulated for properties, enhancing the survival or proliferation of cells, modulating the proliferation of cells, modulating proliferation of cells, modulating the proliferation and/or recells, modulating cardiac insufficiency disorders, wounds, cancerous tumours, retinal disorders or injuries (e.g. loss of sight due to cells, modulating proliferation and/or recells, indicting the proliferation and/or recentration of chondrocytes. In particular, these are useful for certinitis pigmentosum), obesity, diabetes, hyperinsulinaemia, cancerous tumours, retinal disorders or injuries (e.g. loss of sight due to certinitis pigmentosum), obesity, diabetes, hyperinsulinaemia, cancerous conditions are useful in cell death. The polymucleotides are useful in mammals. PRO polypeptides and their portions affect the controlled conditions are useful in the development and controlled screening of therapeutically useful reagents, as probes and for the genetic analysis of individuals with genetic disorders as well as for the genetic analysis of individuals with genetic disorders as well as for the genetic disorders as well as for the controlled to the controlled to the recombinantly expressing the protein and for chromosome identification. The proteins are useful as molecular marker for protein electrophoresis purposes, as therapeutic agents, for screening compounds to identify invention discloses isolated PRO secreted/transmembrane polypeptides

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     those that mimic the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (antagonists). The polynucleotides and proteins are useful for tissue typing. PRO antibodies are useful for immunohistochemical staining and/or assay of sample fluids. Anti-PRO antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        13-NOV-2003.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the mucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptides can be used to raise bioactive molecule to a cell expressing a PRO polypeptides and for modulating the bioactive molecule to a cell expressing a PRO polypeptides are useful for discretive properties are useful for modulating the biological activity of a cell expressing a PRO polypeptides and for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides are useful for stimulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides are useful for stimulating phypertrophy of neonateal cheart, inhibiting vascular endothelial growth factor (VEGP) estimulated proliferation of endothelial cells, modulating the proliferation of cells, inhibiting proliferation of proliferation of cells, modulating the proliferation of cells, modulating proliferation of cells, retinal disorders or injuries (e.g. loss of sight due to retinities) in memmals. PRO polypeptides and their portions affect the expression of genes which have a role in cell death. The polynucleotides are useful in molecular biology including uses as hybridisation probes or cartilities of properties and for the centerion of the properties proliferation of antisense RNA in chromosome and gene mapping, in the generation of antisense RNA in chromosome and gene mapping, in the generation of antisense RNA in proteins are useful as molecular biology including uses as hybridisation probes are useful as molecular biology and provents are well as for creombinative protein and for chromosome identification. The provents are useful as molecular biology and provents are useful for cumulation o

secreted and transmembrane nucleic acids and polypeptides, designated PRO, useful for treating inflammation, organ failure, atherosclerosis, diac injury, infertility, birth defects, premature aging, AIDS, or

Example 42; SEQ ID NO 286; 473pp; English

The invention discloses isolated PRO secreted/transmembrane polypeptides CC and the nucleic acid encoding them. The polypeptides can be used to raise CC antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for modulating CC at least one biological activity of a cell. PRO polypeptides are useful CC for detecting other PRO polypeptides in a sample and for linking a bioactive molecule to a cell expressing a PRO polypeptides are useful CC polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides or CC polynucleotides are useful as pharmaceuticals, diagnostics, biosensors or CC polynucleotides are useful as pharmaceuticals, diagnostics, biosensors or CC polynucleotides are useful for stimulating hypertrophy of neonatal CC polynucleotides are useful for stimulating hypertrophy of neonatal CC polynucleotides are useful for stimulating the proliferation of cc stimulated T-lymphocytes, enhancing the survival or proliferation of CC polynucleotides or rod photoreceptor cells, inducing c-fos in endothelial cc ells, modulating plucose or FRA uptake, inducing proliferation and/or receptor cells, modulating proliferation of colless, modulating or treating cardiac insufficiency disorders, wounds, cancerous tumours, retinal disorders or injuries (e.g. loss of sight due to CC retinitis pigmentosum), obesity, diabetes, hyperinsulinaemia, crocerous the polynucleotides or cartilage disorders (e.g. sports injuries or are useful in molecular history including uses as hyperinsulinaemia, crocerous including uses as hyperinsulinaemia. expression of genes which have a total the control of an english molecular biology including uses as hybridisation for cDNA library to isolate the full-length PRO cDNA or to isolate cDNA including the generation of anticDNA or to isolate other

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            श
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC animals or knockout animals which are useful in the development and CC screening of therapeutically useful reagents, as probes and for the genetic analysis of individuals with genetic disorders as well as for CC recombinantly expressing the protein and for chromosome identification. CC The proteins are useful as molecular marker for protein electrophoresis CC purposes, as therapeutic agents, for screening compounds to identify CC those that mimic the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (antagonists). The polymucleotides and proteins are CC useful for tissue typing. PRO antibodies are useful for tissue typing and/or assay of sample fluids. Anti-PRO antibodies are useful in diagnostic assays for PRO e.g. detecting its cappression in specific cells, tissues or serum and for affinity curification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

New PRO nucleic acid, useful for manufacturing a medicament diagnosing or treating tumor, for chromosome mapping or for

Example 42; SEQ ID NO 286; 463pp; English

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise can bioactive molecule to a cell expressing a PRO polypeptide, for linking a CC bioactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a CC polypeptide antibodies are useful for modulating the biological activity of a cell. PRO polypeptides or the PRO polypeptides or polypeptides are useful as pharmaceuticals, disgnostics, blosensors or for a cell expressing a PRO polypeptides or polypeptides or the province of a cell expressing a property of neonatal companies. These are useful as pharmaceuticals, disgnostics, blosensors or polypucleotides are useful as pharmaceuticals, disgnostics, blosensors or bioreactors. These are useful for stimulating hypertrophy of neonatal companies, inhibiting vascular endothelial growth factor (VEGP) stimulated companies, enhancing the survival or proliferation of continulated promptocytes, enhancing the survival or proliferation of continulated promptocytes, enhancing the survival or proliferation of continulated promptocytes. In particular, these are useful for detecting or treating cardiac insufficiency disorders, wounds, cancerous tumours, retinal disorders or injuries (e.g. loss of sight due to retinities) in mammals. PRO polypeptides and their portions affect the contration of genes which have a role in cell death. The polymucloetides are useful in molecular biology including uses as hybridisation probes con a function and contraction of antisense RNA and contraction CC CDNAB, in chromosome and gene mapping, in the generation of antisense RNA CC and DNA, for preparing PRO polypeptides, for generation of antisense RNA CC animals or knockout animals which are useful in the development and CC screening of therapeutically useful reagents, as probes and for the CC genetic analysis of individuals with genetic disorders as well as for CC recombinantly expressing the protein and for chromosome identification. CC The proteins are useful as molecular marker for protein electrophoresis CC purposes, as therapeutic agents, for screening compounds to identify CC those that mimic the PRO polypeptide (agonists) or prevent the effect of CC the PRO polypeptide (antagonists). The polymucleotides and proteins are useful for tissue typing. PRO antibodies are useful for cimmunohistochemical staining and/or assay of sample fluids. Anti-PRO CC antibodies are useful in diagnostic assays for PRO e.g. detecting its CC purification of PRO from recombinant cell culture or natural sources. The CC purification of PRO from recombinant cell culture or natural sources. The CC penes may also be used in gene therapy, particularly for replacing a CC defective gene. The sequence presented is a PCR primer which was used to amplify a PRO polymucleotide of the invention.

New e.g. condition PRO polypeptide useful for preparing a medicament for treating a dition that is responsive to the PRO polypeptide or anti-PRO antibody. inflammatory diseases, cancer or acquired immunodeficiency syndrome.

Example 42; SEQ ID NO 286; 473pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise at the nucleic acid encoding them. The polypeptides can be used to raise at the nucleic acid encoding them. The polypeptides for linking a bloactive molecule to a cell expressing a PRO polypeptide, for inking a control of the properties and for modulating at least one biological activity of a cell. PRO polypeptides are useful cfor detecting other PRO polypeptides in a sample and for linking a bloactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or polypeptides are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or polynucleotides are useful for stimulating the polypeptides or polynucleotides are useful for stimulating hypertrophy of meonatal control of the properties or polynucleotides are useful for stimulating hypertrophy of neonatal charaction. These are useful for stimulating the proliferation of beart, inhibiting vascular endothelial growth factor (VEGP)-stimulated proliferation of endothelial cells, modulating the proliferation of certinal neurons or rod photoreceptor cells, inducing c-fos in endothelial cells, modulating of choosing the survival or proliferation and/or redifferentiation of chondrocytes, enhancing the survival proliferation and/or redifferentiation of chondrocytes. In particular, these are useful for the proliferation and proved the proliferation of sight due to retinitis pigmentosum), obesity, diabetes, hyperinsulinaemia, or morting or carrillage disorders (e.g. morts in invivis or carrillage disorders (e.g. mor hypoinsulinaemia, or bone or cartilage disorders (e.g. sports injuries or arthritis) in mammals. PRO polypeptides and their portions affect the expression of genes which have a role in cell death. The polynucleotides are useful in molecular biology including uses as hybridisation probes for cDNA library to isolate the full-length PRO cDNA or to isolate other cDNAs, in chromosome and gene mapping, in the generation of antisense RNA and DNA, for preparing PRO polypeptides, for generating transgenic animals or knockout animals which are useful in the development and screening of therapeutically useful reagents, as probes and for the genetic analysis of individuals with genetic disorders as well as for recombinantly expressing the protein are for rhomosome identification.

The polynucleotides and proteins are useful for tissue typing. PRO antibodies are useful for immunohistochemical staining and/or assay of sample fluids. Anti-PRO antibodies are useful in diagnostic assay for SRO e.g. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO polynucleotide of the invention.
                                                                                                                                                                                                                                                    Human secreted/transmembrane protein, #53, PCR primer

                                                                                                                                                                                                                                                                                 The invention discloses isolated PRO secreted/transmembrane polypeptides and the mucleic acid encoding them. The polypeptides can be used to raise and the mucleic acid encoding them. The polypeptides can be used to raise can be discretive molecule to a cell expressing a PRO polypeptide and for modulating to discretive molecule to a cell expressing a PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a proportion and for modulating the biological activity of a cell. PRO polypeptides are useful for modulating the biological activity of a cell expressing a PRO polypeptides are useful for modulating the biological activity of a cell expressing a PRO polypeptides are useful for modulating the biological activity of a cell expressing a PRO polypeptides are useful for modulating the proliferation of anothering the survival or proliferation of plantice are useful for stimulating hypertrophy of meanatal cells, inducing c-fos in emotubality proliferation of cells, modulating the proliferation of cells, inducing proliferation of cells, modulating proliferation of cells, modulating the proliferation and/or recells, modulating particular, these are useful for cells, modulating the proliferation of cells, modulating cardiac insufficiency disorders, womds, cancerous tumours, retinal disorders or injuries (e.g. loss of sight due to retinal prometheum, obesity, disbetes, hyperinsulinaemia, cancerous tumours, retinal disorders or injuries (e.g. loss of sight due to retination of genes which have a role in leath. The polynucleotides are useful in meammals, propolypeptides and heir portions affect the expression of genes which have a role in leath. The polynucleotides or combinately expressing the protein and heir portions affect the expression of proposes and for the generation of antisense RNA in chromosome and gene mapping, in the generating transgenic combinate or hospital should be are useful in the development and correction and to recombinantly expressing the protein and for chromos
                                                                                                                                                                                                                                                         밁
                                                                                                                                             ঠ

probes, DNA, and nucleic acid encoding a PRO polypeptide for use as hybridization bes, in chromosome and gene mapping, in generating antisense RNA and , and in gene therapy for treating e.g. cancer, Parkinson's disease

Example 42; SEQ ID NO 286; 471pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a bioactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing a PRO polypeptides or polymucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. These are useful for stimulating hypertrophy of meonatal heart, inhibiting vascular endothelial growth factor (VEGF)-stimulated

PRO polypeptides and their portions affect the expression of genes which have a role in cell death. The polynucleotides certinitis pigmentals which have a role in cell death. The polynucleotides certinitis pigment and gene mapping, in the generation of antisense RNA cc and DNA, for preparing PRO polypeptides, for generating transgenic companies or knockout animals which are useful in the development and creening of therapeutically useful reagents, as probes and for the generatic analysis of individuals with genetic disorders as well as for the proteins are useful as molecular marker for protein electrophoresis purposes, as therapeutic agents, for screening compounds to identify chose that mind; the proteins are useful for tiesue typing. PRO antibodies are useful for the effect of the proteins are useful in diagnostic assays for small for affinity cannobises and proteins are useful for tiesue typing. PRO antibodies are useful for affinity proteins are useful in diagnostic assays for pRO e.g. detecting its cannobises of proteins are combinant cell culture or natural sources. The proteins are proteins are combinant cell culture or natural sources. The cells in the development 
                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT 1528
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Dest Local S

The invention discloses isolated PRO secreted/transmembrane polypeptides CC and the nucleic acid encoding them. The polypeptides can be used to raise CC antibodies that specifically bind to the PRO polypeptide, for linking a CC bioactive molecule to a cell expressing a PRO protein and for modulating CC at least one biological activity of a cell. PRO polypeptides are useful CC for detecting other PRO polypeptides in a sample and for linking a CC bioactive molecule to a cell expressing a PRO polypeptides. The PRO CC polypeptide antibodies are useful for modulating the biological activity CC of a cell expressing PRO polypeptides. The PRO CC polypeptide are useful as pharmaceuticals, diagnostics, biosensors or CC polynucleotides are useful as pharmaceuticals, diagnostics, biosensors or CC polynucleotides are useful as pharmaceuticals, diagnostics, biosensors or complete the control of the properties of 
              arthritis) in mammals. PRO polypeptides and their portions affect the expression of genes which have a role in cell death. The polynucleotides are useful in molecular biology including uses as hybridisation probes for cDNA library to isolate the full-length PRO cDNA or to isolate other cDNAs, in chromosome and gene mapping, in the generation of antisense RNA can DNA, for preparing PRO polypeptides, for generating transgenic canimals or knockout animals which are useful in the development and continuous control of the repeutically useful reagents, as probes and for the genetic analysis of individuals with genetic disorders as well as for creombinantly expressing the protein and for chromosome identification. The proteins are useful as molecular marker for protein electrophoresis purposes, as therapeutic agents, for screening compounds to identify those that mimic the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (antagonists). The polymucleotides and proteins are useful for tissue typing. PRO antibodies are useful for the protein and staining and/or assay of sample fluids. Anti-PRO antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     02-DEC-1999

analogues. The invention is useful for evaluating candidate antisense oligomer for its ability to inhibit gene expression. The invention is also useful for treating leukaemia or viral infection such as cytomegalovirus (CMV), herpes simplex virus (HSV)-1, HSV-2, HTLV-1, human immuno deficiency virus (HIV)-1, HIV-2, hepatiis B virus (HBV), human papilloma virus (HPV), VZV, influenza virus and rhinovirus. The present

HTLV-1, human

invention relates to novel nucleomonomer and oligomer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC bioactive molecule to a cell expressing a PRO protein and for modulating CC at least one biological activity of a cell. RNO polypeptides are useful CC for detecting other PRO polypeptides in a sample and for linking a CC bioactive molecule to a cell expressing a PRO polypeptide. The PRO CC polypurclectides are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO CC polypurclectides are useful as pharmaceuticals, diagnostics, biosensors or CC polypurclectides are useful as pharmaceuticals, diagnostics, biosensors or CC polypurclectides are useful as pharmaceuticals, diagnostics, biosensors or CC polypurclectides are useful for stimulating hypertrophy of neonatal CC proliferation of endothelial cells, modulating the proliferation of conditions or rod photoreceptor cells, inducing c-fos in endothelial CC retinal neurons or rod photoreceptor cells, inducing proliferation of CC retinal neurons or rod photoreceptor cells, inducing proliferation of CC cells, modulating glucose or FPA uptake, inducing proliferation and/or receptor cells, inducing proliferation of conditions cardiac insufficiency disorders, wounds, cancerous cut tumours, retinal disorders or injuries (e.g. loss of sight due to CC retinitis pigmentosum), obesity, diabetes, hyperinsulinaemia, cancerous cut thirtis) in mammals. PRO polypeptides and their portions affect the CC expression of genes which have a role in cell death. The polymuclectides are useful in molecular biology including uses as hybridisation probes (constitution of proparticely proliferation probes and but, for preparing PRO polypeptides, for generating transgenic cut process, as therapeutically useful reagents, as probes and for the generatic analysis of individuals with genetic disorders as well as for creombinantly expressing the protein arker for protein electrophoresis cut purposes, as therapeutic agents, for screening compounds to identify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

The polypucleotides and proteins are useful for tissue typing. PRO antibodies are useful for immunohistochemical staining and/or assay of sample fluids. Anti-PRO antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO polynucleotide of the invention.

The invention discloses isolated PRO secreted/transmembrane polypeptides CC and the nucleic acid encoding them. The polypeptides can be used to raise CC antibodies that specifically bind to the PRO polypeptide, for linking a CC bioactive molecule to a cell expressing a PRO protein and for modulating a CC discrive molecule to a cell expressing a PRO protein and for modulating a CC polypeptide antibodies are useful for modulating a CC polypeptide antibodies are useful for modulating the biological activity of a cell PRO polypeptides in a sample and for linking a CC polypeptide antibodies are useful for modulating the biological activity of a cell expressing a PRO polypeptides or The PRO cc polypeptides or useful as pharmaceuticals, diagnostics, biosensors or bioreactors. The PRO sequences can be used in gene and protein therapy. The PRO polypeptides or the agonist or antagonist or the treatment of a condition which is responsive to the PRO polypeptide, the agonist or antagonist or the treatment of a condition which is responsive to the PRO polypeptide, the agonist or condition which is responsive to the PRO polypeptide, the agonist or condition which is responsive to the PRO polypeptide, the agonist or condition which is responsive to the PRO polypeptide, the agonist or constant probes for gene mapping, consecutive properties are also useful in the development and screening of consecutar weight markers for protein electrophoresis or as therapeutic agents. Anti-PRO antibodies are useful in diagnostic assays or for the sources. The sequence presented is a PCR primer which was used to amplify a PRO polymented of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New secreted and transmembrane PRO polypeptides and nucleic acids, useful in gene therapy, as molecular weight markers for protein electrophoresis, as hybridization probes or as therapeutic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            22-FEB-2000; 2000WO-US004414.

Novel isolated native PRO polypeptide useful for tissue typing, an molecular weight markers in protein electrophoresis, for treating enterocolitis, Zollinger-Ellison syndrome, congenital microvillus atrophy

Example 42; SEQ ij ĕ 286; 470pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bloactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a bloactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide artibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or polymucleotides are useful as pharmaccuticals, diagnostics, biosensors or bioreactors. These are useful for stimulating hypertrophy of neonatal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC cells, modulating glucose or FFA uptake, inducing proliferation and/or re CC differentiation of chondrocytes. In particular, these are useful for CC differentiation of chondrocytes. In particular, these are useful for CC differential discorders or injuries (e.g. loss of sight due to CC retinitis pigmentosum), obesity, diabetes, hyperinsullnaemia, or bone or cartilage disorders (e.g. sports injuries or CC arthritis) in mammals. PRO polypeptides and their portions affect the CC expression of genes which have a role in cell death. The polynucleotides CC are useful in molecular biology including uses as hybridisation probes CC are contained and gene mapping, in the generation of antisense RNA CC and DNA, for preparing PRO polypeptides, for generating transgenic CC animals or knockout animals which are useful in the development and CC screening of therapeutically useful reagents, as probes and for the CC genetic analysis of individuals with genetic disorders as well as for CC those that mimic the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (antagonists). The polynucleotides and proteins are useful for tissue typing. PRO antibodies are useful for clentify CC those that mimic the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (antagonists). The polynucleotides and proteins are useful in diagnostic assays for PRO e.g. detecting its captured in gene therapy, particularly for replacing a CC expression in specific cells, tissues or serum and for affinity and defective gene. The sequence presented is a PCR primer which was used to complify a PRO polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

```
New isolated or recombinant Rpi-blb nucleic acids and proteins, useful for providing members of the Solanaceae family e.g. Solanaceae tuberosum
                                                                                                                            resistance against comycete infection.
```

Example 7; SEQ ID NO 26; 98pp; English.

disease, in particular comycete infections. The DNA sequence encodes a protein which may provide a plant or its progeny with at least partial resistance against an comycete infection caused by phytophthora infestans. The invention may be useful for the development of compounds with a fungicide activity. The DNA sequence of the invention encodes an Rpi-blb protein comprising 970 amino acids. The nucleic acid, vector, cell, protein or binding molecule is useful for providing a plant or its progeny with resistance against an comycete infection such as late blight (a disease of major importance to production of Solanaceae such as potation and tomato cultivars). The present sequence is that of a PCR primer which was used in the exemplification of the invention. This invention relates to a novel DNA sequence in the field of plant equence encodes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the polypeptide, for linking a complex polypeptide to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. PRO polypeptides are useful complex protein and for modulating a complex protein and protein the protein activity of a cell expressing propertides. The protein activity complex proteins are useful as pharmaceuticals, disgnostics, blosensors or complex protein and protein therapy. The protein the prot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             5

                                                                                                                                                                                                                                                                                                P
```

PRO1868, useful ng squamous cell two isolated nucleic acids encoding a PRO polypeptide, e.g. PRO245 01868, useful for treating psoriasis and epithelial cancers such as squamous cell carcinoma.

Example 42; SEQ ID NO 286; 426pp; English.

Contibodies that specifically bind to the PRO polypeptides can be used to raise can thodoise that specifically bind to the PRO polypeptides can be used to raise contibodies that specifically bind to the PRO polypeptides for linking a bloactive molecule to a cell expressing a PRO polypeptides are useful continuous polypeptide and for modulating continuous polypeptide and for modulating continuous polypeptides are useful for modulating the biological activity of a cell expressing a PRO polypeptides. The PRO colypeptides are useful for modulating the biological activity of a cell expressing a PRO polypeptides or colypurcleotides are useful for stimulating hypertrophy of neonatal theory. These are useful for stimulating hypertrophy of neonatal theory is a stimulated of the proliferation of endothelial cells, modulating the proliferation of coloractors. These are useful for stimulating hypertrophy of neonatal theory is a stimulated T-lymphocytes, enhancing the survival or proliferation and/or recoloractors. These are useful for stimulating the proliferation and/or recoloractors or to photoreceptor cells, inducing proliferation and/or recoloractors. The proliferation of coloractors or injuries (e.g. loss of sight due to cremitation of chondrocytes. In particular, these are useful for cumours, retinal disorders or injuries (e.g. loss of sight due to cremitation probers which have a role in cell death. The polymucleotides or expression of genes which have a role in cell death. The polymucleotides or colonary to isolate the full-length PRO colla or to isolate other coloractors. PRO polypeptides and their portions affect the coloractors of the generation of antisense RNA coloractors of induced the protein are useful for the generation of therapeutically useful respective in the development and coloractors of induced the protein as for protein and for the protein as molecular marker for protein electrophoresis of induced to antisodies are useful for the protein are useful for the protein are useful for the protein are use are useful in specific e.g. detecting its for affinity

The sequence presented is a PCR primer which amplify a PRO polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        07-AUG-2003

New isolated secreted and transmembrane PRO nucleic acids and polypeptides, useful for preventing, diagnosing and treating associated with their aberrant expression and activity. Example 42; SEQ ID NO 286; 476pp; English. and disorders

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptides for linking a bioactive molecule to a cell expressing a PRO polypeptide and for modulating to detecting other PRO polypeptides in a sample and for linking a bioactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a bioactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptides are useful for modulating the biological activity of polypeptides are useful as pharmaceuticals, diagnostics, biosensors or polypucleotides are useful for stimulating hypertrophy of neonatal cells are inhibiting vascular endothelial growth factor (VEGF) estimulated proliferation of endothelial cells, modulating hypertrophy of neonatal proliferation of cells, modulating cardiac insufficiency disorders, wounds, cancerous tumours, retinal disorders or injuries (e.g. loss of sight due to retinitis pigmentosum), obesity, diabetes, hyperinsulinaemia, cure expression of genes which have a role in cell death. The polymucleotides are useful in molecular biology including uses as hybridisation probes or extenditish or chromosome and gene mapping, in the generating transgenic can balvis or knożenia which have a role in cell death. The polymucleotides are useful in a molecular biology including uses as hybridisation of antisense RNA and DNA, for preparing PRO polypeptides, as probes and for the generation of antisense RNA in chromosome and gene mapping, in the generating transgenic can be processed and protein and for chromosome in a probes and for the generation of antisense RNA in the development and correct analysis of individuals with generation or prevent th

tissue New PRO nucleic manufacturing a typing. acid, useful for producing a PRO polypeptide, medicament for diagnosing or treating tumor, or

Example SEQ 片 ö 286; 474pp; English

The invention discloses isolated PRO secreted/transmembrane polypeptides CC and the nucleic acid encoding them. The polypeptides can be used to raise CC antibodies that specifically bind to the PRO polypeptide, for linking a CC bioactive molecule to a cell expressing a PRO polypeptide and for modulating CC at least one biological activity of a cell. PRO polypeptides are useful CC for detecting other PRO polypeptides in a sample and for modulating CC polypeptide antibodies are useful for modulating the biological activity CC polypeptide antibodies are useful for modulating the biological activity CC of a cell expressing PRO polypeptides. The PRO polypeptides or CC polypucleotides are useful for modulating the biological activity CC foreactors. These are useful for stimulating typertrophy of meonatal CC bioreactors. These are useful for stimulating typertrophy of meonatal CC bioreactors. These are useful for stimulating typertrophy of meonatal CC bioreactors. The endothelial cells, modulating the proliferation of control cells, modulating the proliferation of CC retinal neurons or rod photoreceptor cells, inducing c-fos in endothelial CC ells, modulating glucose or FPA uptake, inducing proliferation and/or receptor cells, modulating or treating cardiac insufficiency disorders, wounds, cancerous cutmours, retinal disorders or injuries (e.g. loss of sight due to CC retinitis pigmentosum), obesity, diabetes, hyperinsulinaemia,

PRO polypeptides and their portions affect the caxpression of genes which have a role in cell death. The polynucleotides are useful in molecular biology including uses as hybridisation probes (C conna), in chromosome and gene mapping, in the generation of antisense RNA (C and DNA), for preparing PRO polypeptides, for generating transgenic (C animals or knockout animals which are useful in the development and (C genetic analysis of individuals which are useful in the development and (C genetic analysis of individuals with genetic disorders as well as for (C the proteins are useful as molecular marker for protein electrophoresis (C purposes, as therapeutic agents, for screening compounds to identify (C these that minic the PRO polypeptide (agonists) or prevent the effect of (C the PRO polypeptide (antagonists)). The polymucleotides and proteins are (C useful for tissue typing. PRO antibodies are useful for c useful for the section in specific cells, tissues or serum and for affinity (C purification of PRO from recombinant cell culture or natural sources. The C purification of PRO from recombinant cell culture or natural sources. The G penes may also be used in gene therapy, particularly for replacing a C defective gene. The sequence presented is a PCR primer which was used to CC amplify a PRO polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches 16;

The composition has anorectic activity. The polynucleotide composition may be used in gene therapy to treat the disorders of the invention. The composition is useful for diagnosing obesity related to the disorder. The MCHR1 protein or polynucleotide is useful for preparing a medicament for treating or preventing obesity related to the disorder. The MCHR1 protein or polynucleotide is useful for preparing a medicament for treating or preventing obesity related to the presence of a molecular variant of the MCHR1 gene. This polynucleotide by the composition of the MCHR1 gene.

(GETH) GENENTECH INC

Godowski PJ, Grimaldi Mather JP, Pan J, Pa Williams PM, Wood WI; Botstein D, Desnoyers L, Eaton DL, Pong S, Gao W, Gerber H, Gerritsen Grimaldi JC, Gurney AL, Hillan KJ, an J, Paoni NF, Roy MA, Stewart TA, Ferrara N;
nME, Goddard /
Kljavin IJ;
Tumas D;

New nucleic acid encoding a PRO polypeptide, useful recombinant PRO polypeptide and for treating tumors for producing a by gene therapy.

Example 42; SEQ ID NO 286; 471pp; English.

cc and the nucleic acid encoding them. The polypeptides can be used to raise disactive molecule to a cell expressing a PRO protein and for medulating a bioactive molecule to a cell expressing a PRO protein and for medulating cof a cell expressing a PRO protein and for medulating cof a cell expressing PRO polypeptides are useful for detecting other PRO polypeptides. The PRO polypeptides are useful for medulating the biological activity of a cell expressing PRO polypeptides for inking a complex protein and for medulating cofficients are useful as pharmaceuticals, diagnostics, biosensors or polymentides. The PRO polypeptides or complex proteins are useful as pharmaceuticals, diagnostics, biosensors or polymentides. The PRO polypeptides or complex proteins are useful as pharmaceuticals, diagnostics, biosensors or complex proteins are useful for stimulated proliferation of endothelial cells, modulating the proliferation of complex proteins are useful for cells, inducing cross in endothelial cells, inducing cross in endothelial cells, inducing proliferation of cells, contained the complex proteins and/or recombinating or treating cardaic insufficiency disorders, wounds, cancerous the captures, retinal disorders or injuries (e.g. loss of sight due to retinitis pigmentosum), obesity, diabetes, hyperinaulinaemia, hypoinsulinaemia, or bone or cartilage disorders (e.g. sports injuries or arthritis) in mammals. PRO polypeptides and their portions affect the expression of genes which have a role in cell death. The polynucleotides are useful in molecular biology including uses any hyperination probes of cor cnwal hibrary to isolate the full-length PRO cDNA or to isolate other spurposes, as therapeutic agents, for generating transgenic cannesses, as therapeutic agents, for generating transgenic composes, as therapeutic agents, for screening compounds to identify those that mimic the PRO polypeptides are useful for the sequence presented is a recurrent the effect of the protein and for chromosome electroporesis purposes, as th discloses isolated PRO O secreted/transmembrane polypeptides
The polypeptides can be used to raise
o the PRO polypeptide, for linking a
sing a PRO protein and for modulating

Isolated secreted and transmembrane PRO nucleic acids and the proteins they encode, e.g. PRO245, PRO269 and PRO1868, useful for preventing, diagnosing and treating e.g. disorders relating to blood coagulation.

Example 42; SEQ ID NO 286; 478pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bloactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a bloactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing to modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or polymucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. These are useful for stimulating hypertrophy of neonatal heart, inhibiting vascular endothelial growth factor (VEGP)-stimulated raise

```
CC hypoinsulinaemia, or bone or cartilage disorders (e.g. sports injuries or carthritis) in mammals. PRO polypeptides and their portions affect the cexpression of genes which have a role in cell death. The polypucleotides care useful in molecular biology including uses as hybridisation probes company to isolate the full-length PRO cDNA or to isolate other converse and gene mapping, in the generation of antisense RNA commands or knockout animals which are useful in the development and commands or knockout animals which are useful in the development and commands or knockout animals which are useful in the development and commands or knockout animals which are useful in the development and commands or knockout animals which are useful in the development and commands or knockout animals which are useful in the development and commands or the proteins are useful as molecular marker for proteins as well as for combinantly expressing the protein and for chromosome identification. The proteins are useful as molecular marker for protein electrophoresis comproses, as therapeutic agents, for screening compounds to identify these that mimic the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (antagonists). The polynucleotides and proteins are cuseful for tissue typing. PRO antibodies are useful for commands to identify the commands of protein and/or assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity compounds to the commands of the protein and for replacing a defective gene. The sequence presented is a PCR primer which was used to camplify a PRO polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

CC and the nucleic sold encoding them. The polypeptides can be used to raise that especifically bind to the PRO polypeptide, for linking a combinator worker wookenule to a cell expressing a PRO protein and for modulating complete the molecule to a cell expressing a PRO polypeptide are useful for detecting other PRO polypeptides in a sample and for linking a bioactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing a PRO polypeptides. The PRO polypeptides or complete the PRO polypeptides are useful for stimulating the biological activity of a cell expressing PRO polypeptides or polypeptides or complete the PRO polypeptides or polypeptides or provide antibodies are useful for stimulating the proliferation of the proliferation of extending vascular endothelial growth factor (VEGF) stimulated proliferation of extending the survival or proliferation of the proliferation of complete the proliferation of complete the proliferation of complete the proliferation of complete the proliferation and/or retainal neurons or rod photoreceptor cells, inducing cross in endothelial complete the proliferation and/or retainal neurons or the proliferation and/or retainal neurons or the proliferation and/or retainal disorders or injuries (e.g. loss of sight due to complete the proliferation of the prolection of chondrocytes. In particular, these are useful for cells, inducing cross injuries or calls the proliferation of proliferation probes or cartification of proliferation of properties or properties and prolemantal properties which have a role in cell death. The polymucleotides are useful in molecular biology including uses as hybridisation of proliferation. The proliferation of proliferation of proliferation of proliferation of proliferation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         S
                    The invention describes a new isolated nucleic acid comprising a fully CC defined sequence having 23574 bp or at least its 50 or 15 contiguous CC nucleotides and includes: allele G of single nucleotide polymorphism CC (SNP) AB+2; allele G of SNP BC+1; and allele C of SNP BC+2. The invention CC describes identifying increased susceptibility to a disorder comprising CC asthma, bronchial hyperresponsiveness, atopy, chronic obstructive lung CC disease and adult respiratory distress syndrome in a subject comprising CC testing a biological sample obtained from a subject for the presence of CC testing a biological sample obtained from a subject for the presence of CC nucleic acid is useful for preparing a composition for treating disorders CC comprising asthma, bronchial hyperresponsiveness, atopy, chronic CC comprising asthma, bronchial hyperresponsiveness, atopy, chronic CC obstructive lung disease and adult respiratory distress syndrome. This CC sequence represents a primer used to detect single nucleotide CC polymorphisms in the human gene 216.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Best Local Similarity 88.9

```
can thouse isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise anthodies that specifically bind to the PRO polypeptides for linking a bioactive molecule to a cell expressing a PRO polypeptide and for modulating can be used to raise of a cell expressing a PRO polypeptide and for linking a bioactive molecule to a cell expressing a PRO polypeptide and for linking a complete properties are useful for modulating the biological activity of a cell expressing a PRO polypeptide and for linking a properties are useful as pharmaceuticals, diagnostics, biosensors or polymentectides are useful for stimulating the biological activity of a cell expressing a PRO polypeptide and for linking a proliferation of endothelial cells, modulating the proliferation of chart, inhibiting vascular endothelial growth factor (VEGP)-stimulated for the proliferation of chart inhibiting processes or FFA uptake, inducing c-fos in endothelial cells, modulating the proliferation of cells, modulating proliferation of chart control of chart contr

The invention discloses isolated PRO secreted/transmembrane polypeptides can the nucleic acid encoding them. The polypeptides can be used to raise of antibodies that specifically bind to the PRO polypeptide, for linking a conditive molecule to a cell expressing a PRO protein and for modulating a tleast one biological activity of a cell. PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a conditive molecule to a cell expressing a PRO polypeptides are useful for modulating the biological activity of a cell expressing a PRO polypeptides or conditions are useful as pharmaceuticals, diagnostics, biosensors or for a cell expressing PRO polypeptides or polypeptides are useful for stimulating the biological activity of a cell expressing a PRO polypeptides or conditions of the proliferation of polypeptides are useful for stimulating the proliferation of the proliferation of endothelial cells, modulating the proliferation of the final dispression of conditions or rod photoreceptor cells, inducing c-fos in endothelial cells, modulating glucose or FPA uptake, inducing proliferation and/or redifferentiation of chondrocytes. In particular, these are useful for tumours, retinal dispress or injuries (e.g. loss of sight due to cells, individed the conditions of genes which have a role in cell death. The polymucleotides are useful in molecular biology including uses as hybridisation probes for cDNA library to isolate the full-length PRO cDNA or to isolate other cDNA, for preparing PRO polypeptides, for generation of antisense RNA and DNA, for preparing PRO polypeptides, for generating transgenic cultures and manuals or knockout animals which are useful in the development and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    screening of therapeutically useful reagents, as probes and for the genetic analysis of individuals with genetic disorders as well as for recombinantly expressing the protein and for chromosome identification. The proteins are useful as molecular marker for protein electrophoresis purposes, as therapeutic agents, for screening compounds to identify those that mimic the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (antagonists). The polynucleotides and proteins are useful for tissue typing. PRO antibodies are useful for immunohistochemical staining and/or assay of sample fluids. Anti-PRO antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from recombinant cell culture or natural sources. The pRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO polynucleotide of the invention.

                                                                                                                                                                                                                                       The present invention relates to a polynucleotide isolated from a human gene and is useful for detecting a single nucleotide polymorphism in a human gene or for diagnosing of disease. The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel polynucleotide useful for PCR amplification along with two DNA fragment from another set of sequences, or for detecting single nucleotide polymorphism in human gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI;
                                                                                                                                                                                                                                                                                                                                                                                                            Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     08-MAR-2002; 2002JP-00064373.
